7. Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

Aim

To integrate the Student Admission Enquiry Management application developed in Zoho Creator with Zoho CRM using a secure service connection and an admission-enquiry submission workflow, with the goal of reducing manual data entry and supporting centralized admissions follow-up.

Objective

- Understand how to create and enable a Zoho CRM connection within Zoho Creator.
- Configure a form workflow that can initiate data transfer after an admission enquiry is submitted.
- Identify the student details that may be mapped to Zoho CRM, such as name, email, contact number, and preferred course.
- Observe the difference between an enabled connection/workflow and a fully tested CRM synchronization.

Prerequisites and Tools Required

- Zoho Creator application: Student Admission Enquiry Management.
- Source form: Admission_Enquiry_Form.
- Zoho CRM access with the appropriate authorization and record-creation permission.
- A suitable Zoho CRM destination module, such as Leads, and a mapping of required fields.

Procedure

Step 1: Create the Zoho CRM Connection

Open Zoho Creator and navigate to Microservices / Connections. Create a connection to Zoho CRM named **Student Admission CRM Connection**, with link name **student_admission_crm_connection**. Authorize the account and enable connection access for the Student Admission Enquiry Management application.

Step 2: Configure the Form Submission Workflow

Open Workflow > Form workflows for **Admission_Enquiry_Form**. Add the workflow **Sync_Admission_Enquiry_to_CRM** under Created > Successful form submission. The intended action is to send the submitted student details to a Zoho CRM record using an appropriate service task or Deluge API request.

Step 3: Map Admission Fields

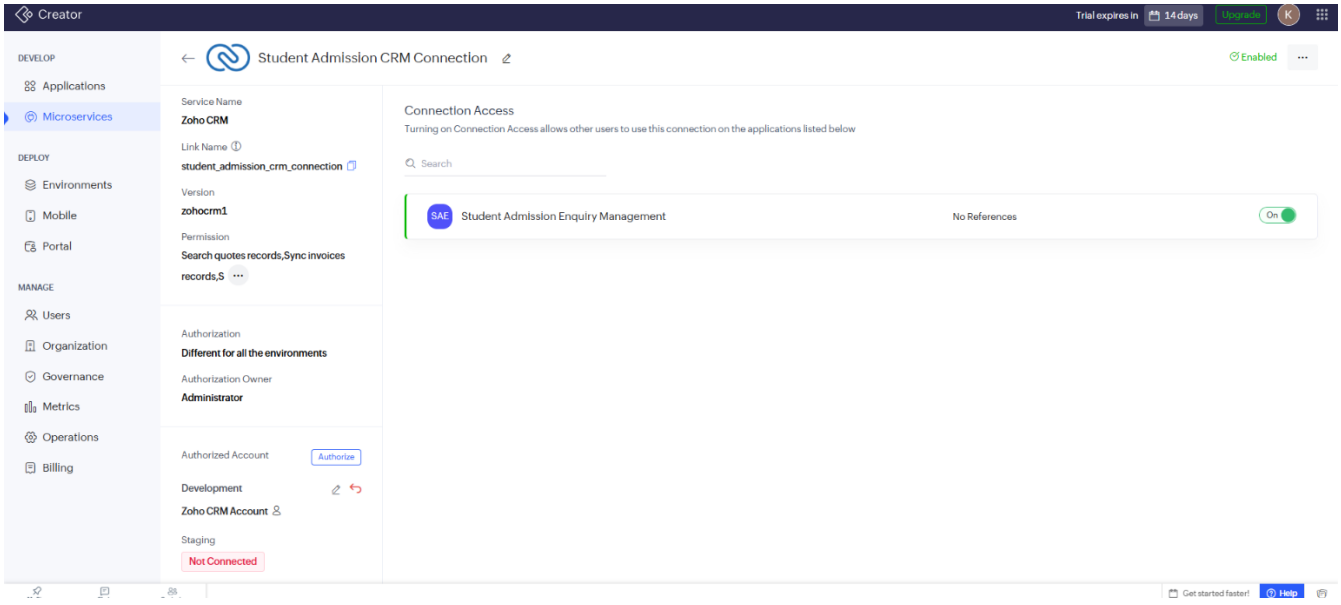

Define the correspondence between the form fields and the destination CRM fields. Example: Student Name to CRM name fields, Email Address to Email, Contact Number to Phone, and Preferred Course to a suitable CRM field. Validate required CRM fields before submission.

Step 4: Test Integration

Add a sample enquiry, execute the configured CRM action, inspect the workflow execution response, and verify that the resulting record appears in the chosen Zoho CRM module. Check errors and duplicate handling before treating synchronization as complete.

Screenshots

Figure 1. Student Admission CRM Connection settings and connection access.

Implementation Screenshots (Continued)

Figure 2. Form workflow list, including Sync_Admission_Enquiry_to_CRM.

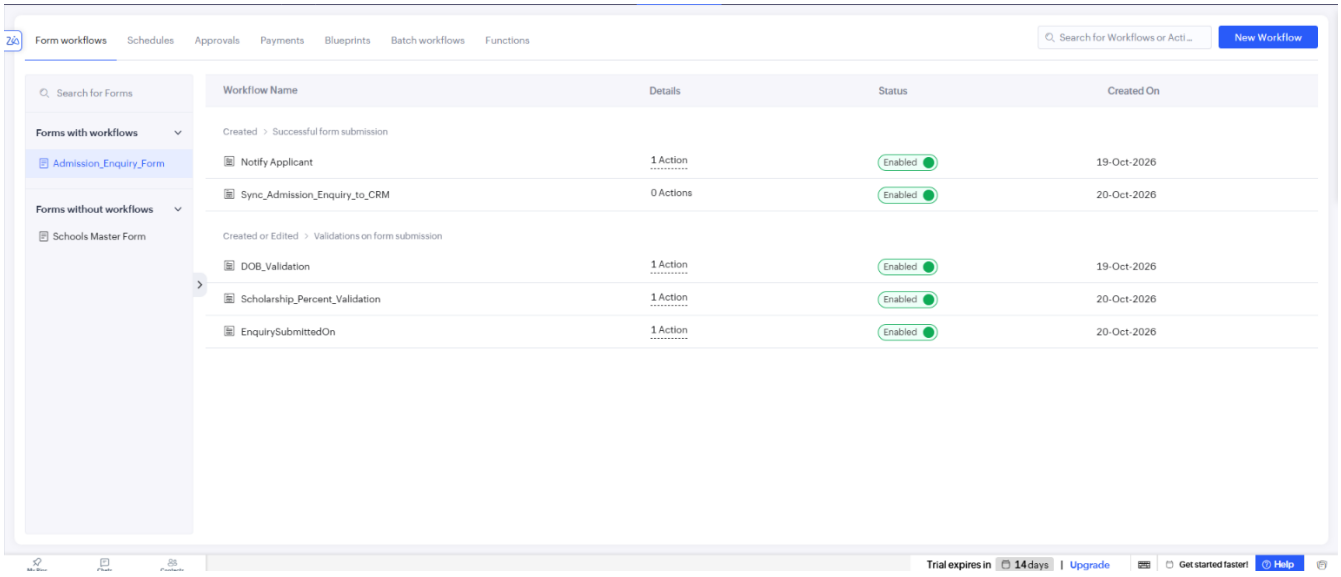

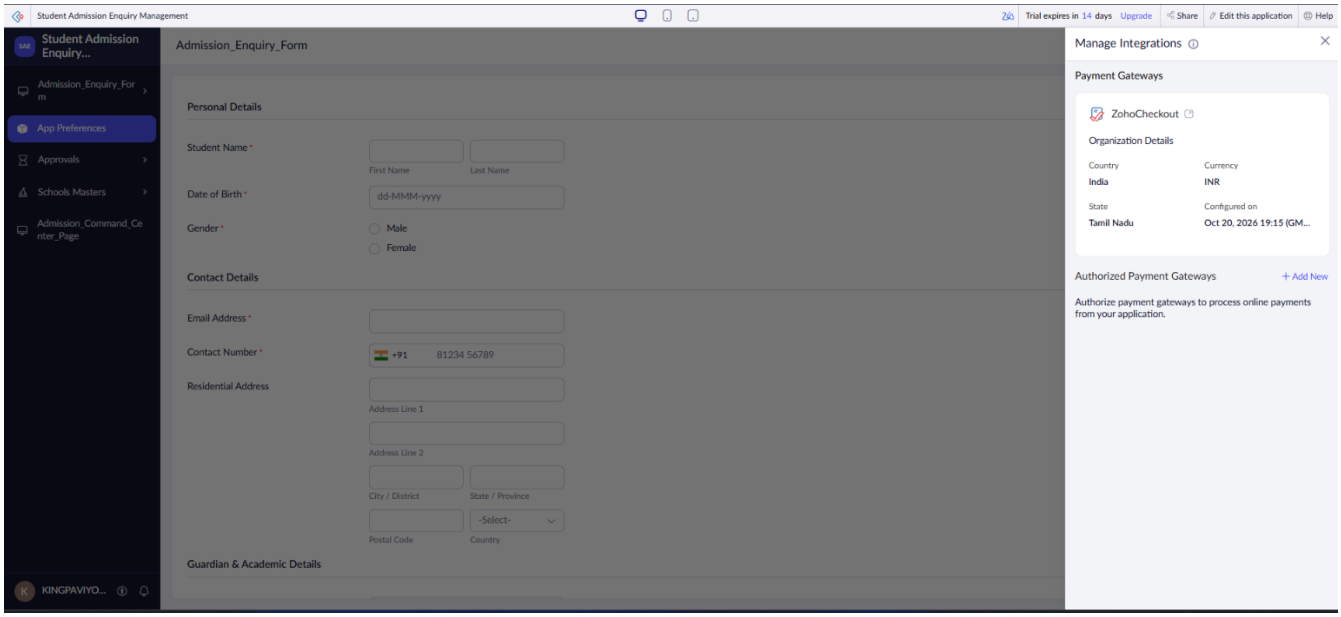

Figure 3. ZohoCheckout integration settings displayed in the application (a separate payment integration).

Observed Configuration and Limitations

- The Zoho CRM connection is shown as enabled, and connection access is turned on for the admission application. The development account is shown, while staging is marked Not Connected.
- The Sync_Admission_Enquiry_to_CRM workflow is enabled, but shows **0 Actions**; therefore, its CRM record-creation logic has not been demonstrated.
- The payment integration screenshot shows ZohoCheckout organization details, which are separate from CRM data synchronization.
- No screenshot confirms a CRM record created from an enquiry. A successful end-to-end synchronization cannot yet be verified.

Result

The Student Admission Enquiry Management application was prepared for integration with Zoho CRM through an enabled Creator connection and a form-submission workflow. The connection and workflow setup were documented using project screenshots. As the CRM synchronization workflow currently contains no actions and no destination CRM record is shown, completion of automated data transfer remains pending configuration and testing.
