8.Configuring User Management and Role-Based Access Control (RBAC)

1. Aim

To configure user management, assign custom roles, and implement Role-Based Access Control (RBAC) in the **Job Application** (Recruitment Portal) built using Zoho Creator to secure applicant data and restrict form/report permissions based on user personas (e.g., HR Manager, Interviewer, Candidate).

2. Objective

- Learn how Zoho Creator manages user provisioning, user invites, and role structures.
- Create and define distinct custom **Roles** (**HR Manager**, **Interviewer**, **Candidate**) with specific permission sets.
- Enforce component-level restrictions so users only interact with authorized **Forms**, **Reports**, and **Pages**.
- Implement dynamic record-level criteria filters using system variables like `zoho.loginuser` to maintain data privacy.

3. Tools Required

- **Zoho Creator Account** with Administrator permissions.
- **Job Application** containing:
  - Forms: `Candidate_Application`, `Interview_Feedback`, `Job_Opening_Setup`.
  - Reports: `All_Candidates`, `Shortlisted_Candidates`.

4. Procedure

Step 1: Defining Roles in Zoho Creator

Establish the security tiers and functional roles required within the recruitment workflow.

1. Open your **Job Application** app in the Zoho Creator builder mode.
2. Navigate to **Users & Permissions** from the left-hand menu.

3. Select the **Roles** tab and click **Add Role** to create three customized profiles:
    a. **`HR Manager`**: Full operational control over job openings, candidate evaluations, status changes, and user management.
    b. **`Interviewer`**: Can view candidate details assigned to them and submit interview scorecards, but cannot modify core job configurations or delete candidate logs.
    c. **`Candidate`**: External or limited internal role; restricted to submitting their initial application and viewing their own application status.

Step 2: Configuring Component-Level Permissions

Set up what each role is permitted to see, add, edit, or delete across different application elements.

1. Within the **Users & Permissions** section, navigate to the **Permissions** tab.
2. Select a target role (e.g., **Interviewer**) from the dropdown menu.
3. Configure access parameters for components:
    a. **`Candidate_Application` Form:** Set to **Read-Only** or **No Access** for Interviewers; **Read/Write** for HR Managers.
    b. **`Interview_Feedback` Form:** Set to **Read/Write** for Interviewers so they can submit scoring evaluations.
    c. `All_Candidates` Report:
        i. *HR Manager*: **Full Access** (View, Add, Edit, Delete).
        ii. *Interviewer*: **View Only** (Filtered to view candidates scheduled for their panel).
        iii. *Candidate*: **Restricted** (Configured with record-level criteria).

Step 3: Implementing Record-Level Criteria Filtering

To ensure candidates can only view their own records and protect applicant privacy:

1. Click on your **`All_Candidates`** report (or applicant-facing status report) in the builder.
2. Go to **Report Properties** > **Criteria**.
3. Apply a dynamic runtime filter based on the logged-in user email:

Code snippet

```
Email_ID == zoho.loginuser
```

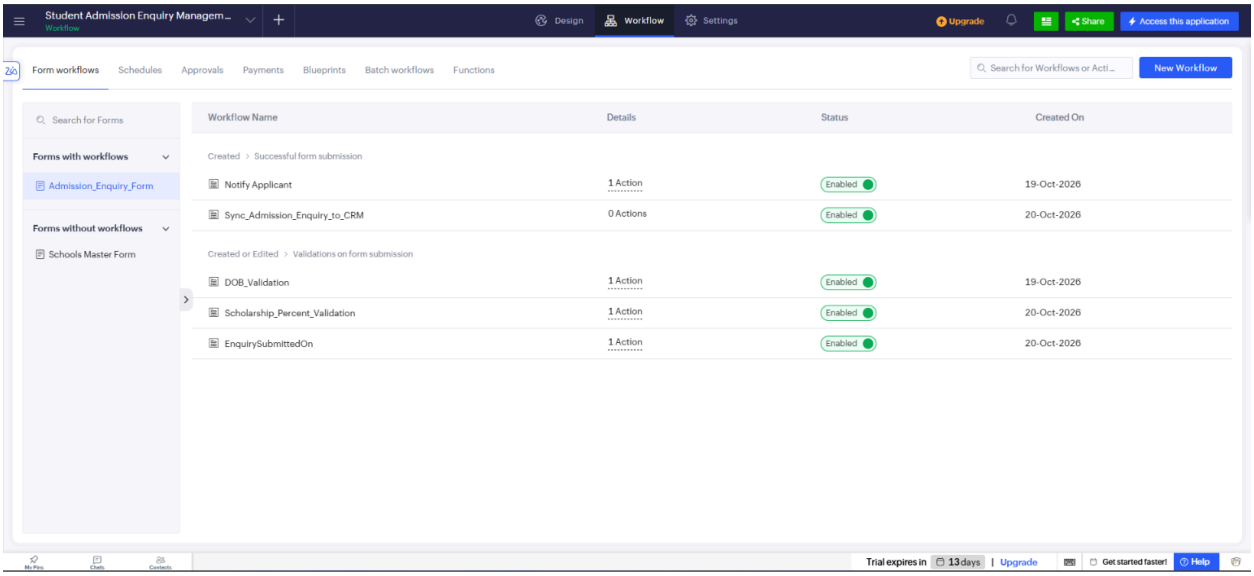

4. *Note:* HR Managers and Interviewers are assigned separate reports or unfiltered permissions through their respective role configurations.

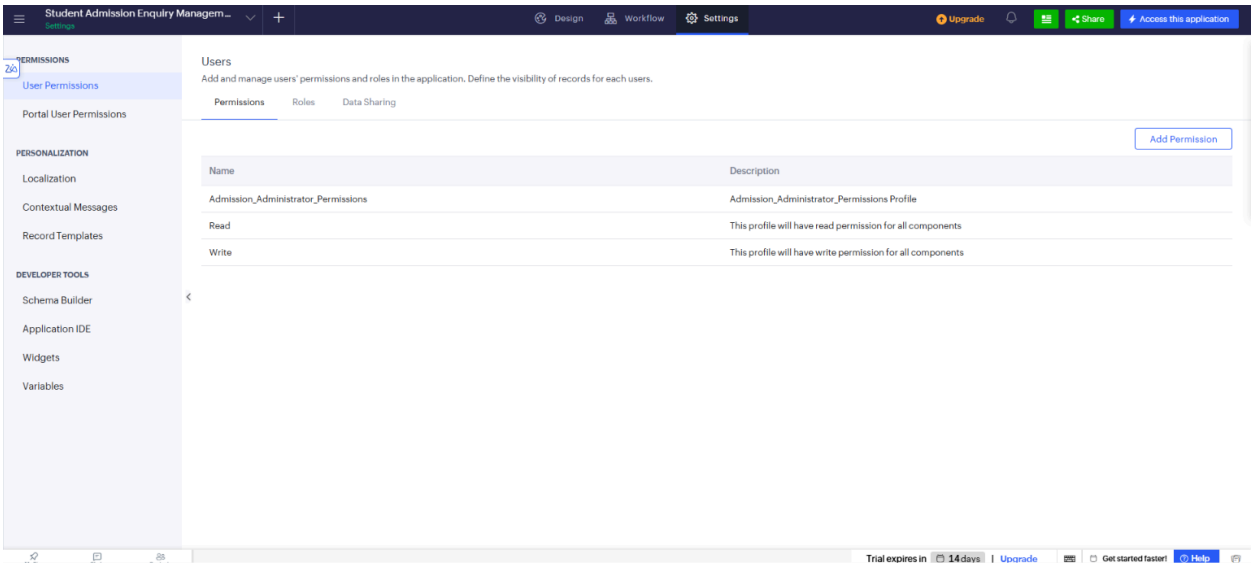

Step 4: Inviting Users and Assigning Roles

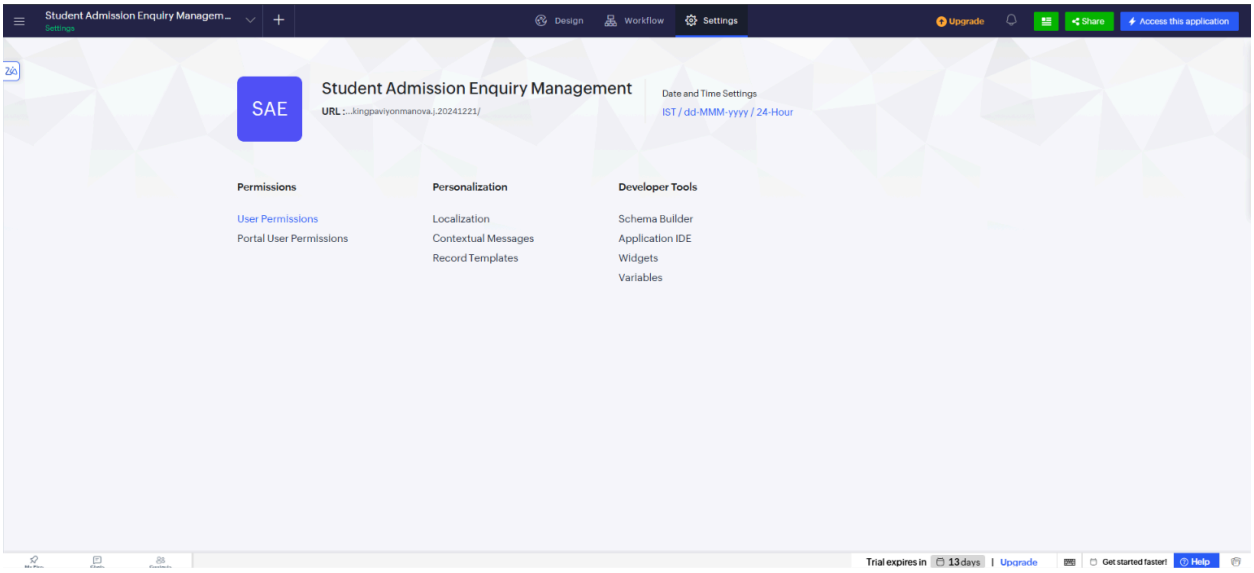

Once permissions and access parameters are locked down, onboard users into the workspace.

1. Navigate to **Users & Permissions** > **Users** tab.
2. Click **Invite User**.
3. Input the user's email address (e.g., the corporate email of a hiring manager or interviewer).
4. Choose the appropriate assigned **Role** (e.g., select `Interviewer`).
5. Click **Send Invitation** to dispatch the secure onboarding invite via email.

6. Result

User management and Role-Based Access Control (RBAC) were successfully configured for the **Job Application** system. By structuring precise roles, component permissions, and dynamic filters via `zoho.loginuser`, strict data security, privacy compliance, and smooth workflow segregation were achieved across all recruitment user tiers.
