9. Exploring AI-Assisted Features and Built-In Analytics (Zia)

1. Aim

To explore AI-assisted features and built-in analytics through Zoho Creator Zia Build Agent for the Student Admission Enquiry Management application, using natural-language prompts to obtain form-improvement suggestions, interpret dashboard requirements, and recommend admission analytics.

2. Objectives

- Understand the role of Zia in AI-assisted application development and natural-language interaction.
- Obtain intelligent feature recommendations for the Admission_Enquiry_Form.
- Explore admission dashboard analytics and identify the limitations of accessing live records through Build Agent.
- Request recommendations for course demand, admission status, and academic performance reports.

3. Tools Required

- Zoho Creator application: Student Admission Enquiry Management.
- Admission_Enquiry_Form with sample applicant records.
- Admission_Command_Center_Page containing enquiry totals and course-wise chart.
- Zoho Creator Zia Build Agent available through the application interface.

4. Procedure

Step 1: Open Zia Build Agent and test chart creation

Open Student Admission Enquiry Management, navigate to Admission_Command_Center_Page, and open the Build Agent panel. Ask Zia to create a bar chart of student admission enquiries grouped by Preferred Course from Admission_Enquiry_Form. Observe and capture the response. The request returned a chart creation failure because Build Agent could not add charts to the existing ZML page.

Step 2: Explore AI-powered form suggestions

Enter a prompt requesting five AI-powered features for Admission_Enquiry_Form without changing the application. Review suggested functions such as enquiry priority scoring, intelligent document verification, predictive counselling scheduling, and sentiment analysis of applicant statements.

Step 3: Query admission data and dashboard insights

Ask Zia to analyze total admission enquiries, the most preferred course, and the role of the dashboard chart. Review the reply and note that Build Agent can describe the application structure but cannot access live database records or the displayed dashboard values directly.

Step 4: Generate analytics report suggestions

Ask Zia for three reports based on Preferred Course, Enquiry Status, and Class XII Percentage. Review its suggested visualization types, data fields, and purposes, including a course-demand/conversion report and an academic-performance versus status report.

5. Observations

- The dashboard visibly displayed 9 total admission enquiries and a course-wise bar chart. These values were read from the dashboard screenshot, not calculated by Zia.
- The chart-generation request failed due to Build Agent support limitations for editing an existing ZML page.

- Zia successfully generated AI feature suggestions and proposed analytics report designs in natural language.
- Build Agent explicitly stated that it could not access live database records for exact counts or verify current chart performance.

6. Result

Zia Build Agent was successfully explored for natural-language assistance, admission-feature ideation, and analytics report recommendations in the Student Admission Enquiry Management application. However, direct AI chart creation in the existing ZML page and live-record conversational analytics were not demonstrated successfully. The exercise therefore establishes exploratory use of AI assistance, not deployment of a working AI automation.
